

FIRE: The FHIR-Integrated Revenue Engine

Solving The Last Mile of Healthcare AI.

A deterministic, multi-agent pipeline that autonomously recovers lost Medicare revenue buried in unstructured clinical notes.

CMS V28: The Rules Have Changed.

Under the new Medicare V28 risk-adjustment model, generic diagnoses are worth \$0. Hospitals are hemorrhaging millions in revenue simply because doctors aren't documenting specifics in their notes.

Precision is no longer optional;
it's the only way to get paid.

You Can't Hire Your Way Out of This.

Current Clinical Documentation Integrity (CDI) relies entirely on expensive, manual human review. It is slow, prone to error, and impossible to scale across 10,000+ patient panels.

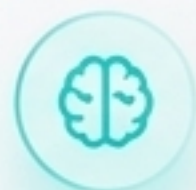

Autonomous Revenue Recovery

FIRE deploys an orchestrated team of specialist AI agents directly onto your FHIR server

1. Triage patients automatically

2. Identify high-value, undocumented HCC gaps

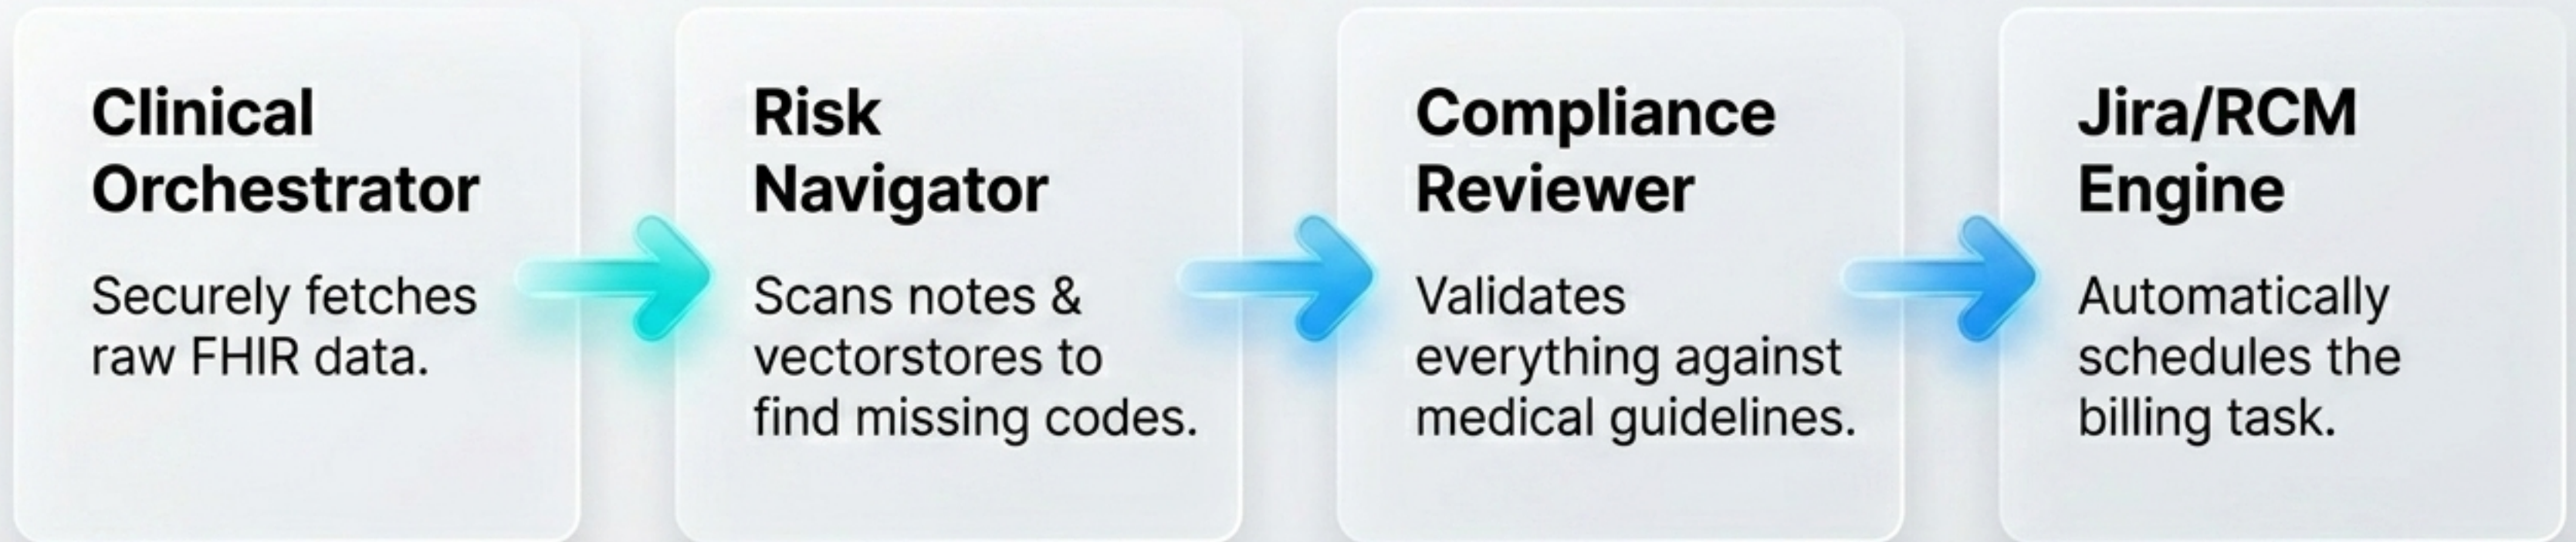

3. Draft verified physician queries instantly

The Glass-Box Pipeline.

A seamless Agent-to-Agent (A2A) handoff. Zero human bottlenecks.

Built for the Enterprise, Grounded in Truth.

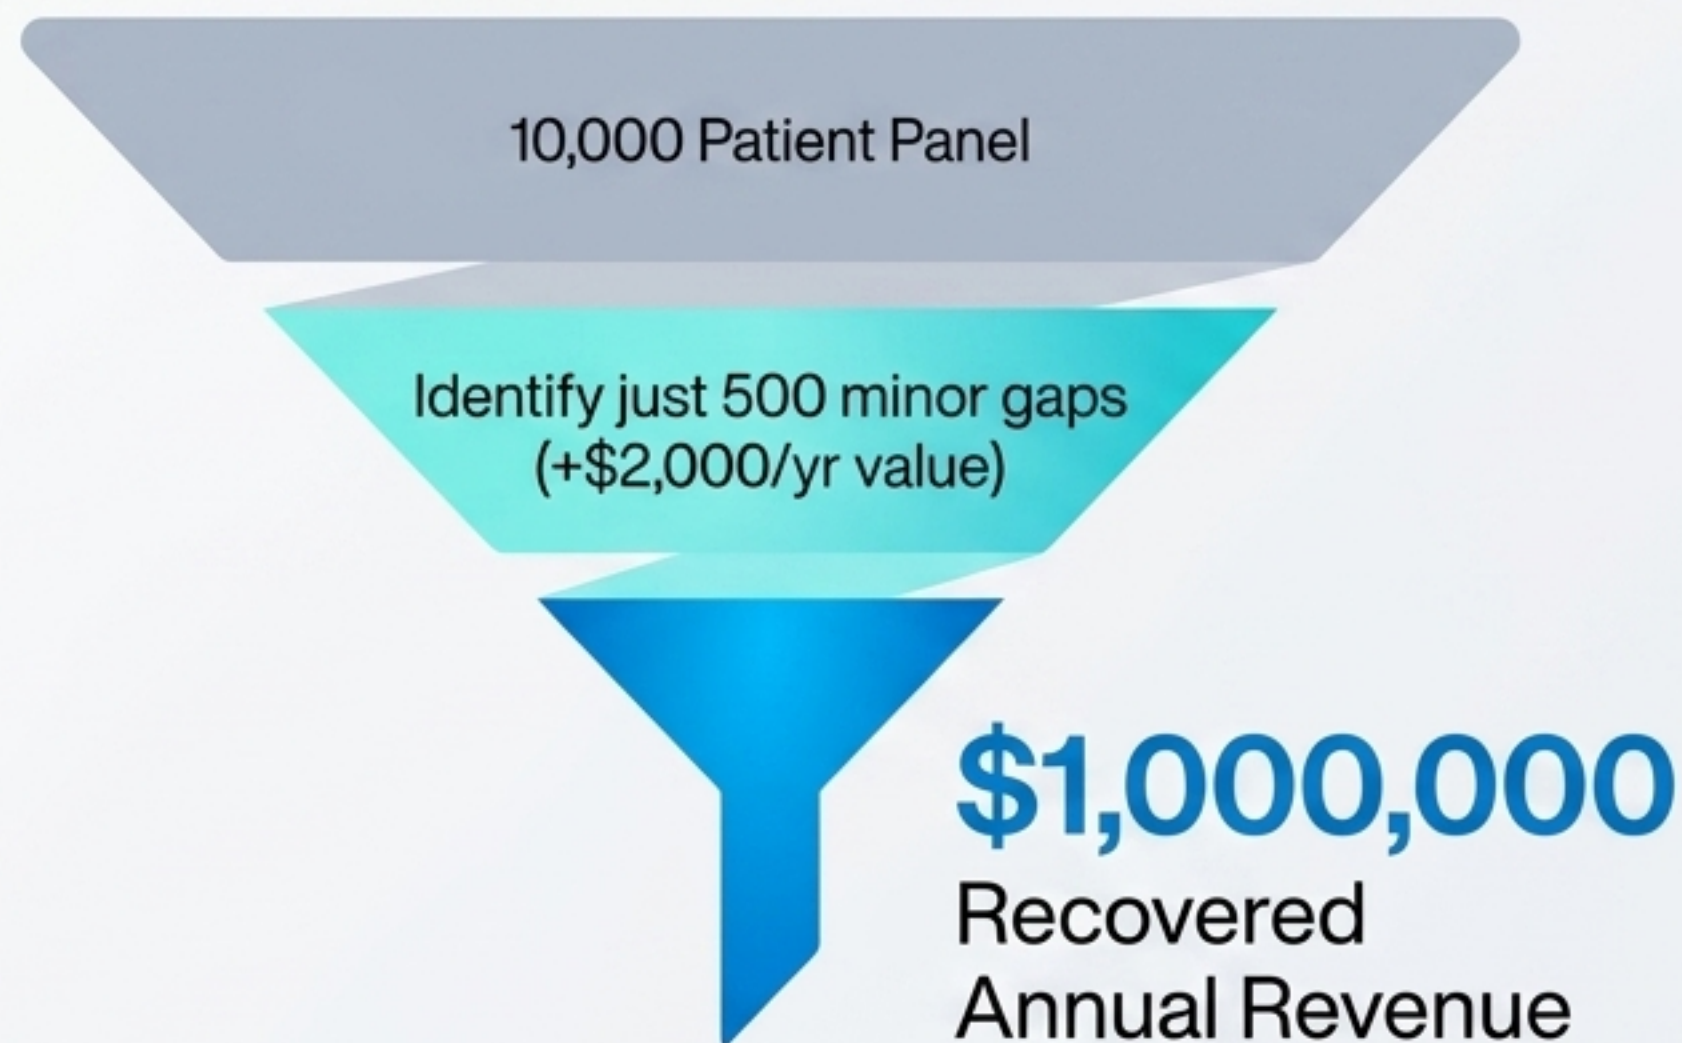

We solved the trust problem. FIRE uses the SHARP extension spec to securely intercept native EHR credentials—no rogue API keys.

Every single proposed billing code is validated against native PubMed databases and CMS M.E.A.T. standards before it reaches a human.
Zero LLM hallucinations.

\$0 Upfront. Pure Shared Savings.

We align perfectly with hospital outcomes.

The Endgame of Healthcare AI is Here.

The word "FIRE" is displayed in a bold, sans-serif font, centered within a light blue rounded rectangle that has a subtle glow effect.

FIRE
